2. Which of the following statements is correct about the function of lateral movement in network penetration?

☐ A. An attacker obtains the IP address, domain name, active port, and communication information of the target network through scanning monitoring to lay a foundation for subsequent attacks.

☐ B. After accessing the target system, the attacker cannot perform lateral movement due to a lack of privileges. Therefore, the attacker needs to obtain higher privileges.

☐ C. Lateral movement is to penetrate other devices that may have vulnerabilities on the network through controlled hosts or servers.

☐ D. Communicate with the customer to understand the target of the penetration test, such as the system, server, and IP address.
